1. Round 1

1.1. Reviewer 1

Reviewer:

- The study's exploration of attachment styles and self-compassion as factors influencing social well-being in HIV patients is a significant contribution to psychological and medical research.
- Recommendations for future research include a more diverse sample and potentially longitudinal studies to further validate these findings.

Authors uploaded the revised manuscript.

1.2. Reviewer 2

Reviewer:

The research design and methodology, including the use of validated scales and statistical analysis, provide a solid foundation for the study's conclusions.

The results indicating the mediating role of self-compassion between attachment styles and social well-being offer valuable insights for healthcare providers working with HIV patients.

The article suggests that interventions focusing on developing self-compassion could potentially improve the social well-being of HIV patients.

The study is a commendable effort in understanding the psychological aspects of living with HIV and offers practical implications for enhancing patient care.

Authors uploaded the revised manuscript.
