1. Round 1

1.1. Reviewer 1

Reviewer: The article presents a novel and insightful analysis of the general health of Iranian immigrants, with a focus on the roles of cognitive flexibility, perfectionism, and acculturation stress. Methodology is sound, with a well-defined sample and appropriate statistical analysis tools.

Decision: Accept after Minor Revisions

The authors could elaborate more on the theoretical framework underpinning their hypotheses, particularly the linkage between cognitive flexibility, perfectionism, and acculturation stress.

The article would benefit from a deeper discussion on the implications of these findings for mental health practitioners working with immigrant populations.

Authors uploaded the revised manuscript.

1.2. *Reviewer 2*

Reviewer: The study addresses a significant and under-researched area, providing valuable insights into the mental health of Iranian immigrants.

The authors should consider expanding the literature review to include more recent studies for a comprehensive understanding of the topic.

A more detailed discussion on the limitations of the study, particularly concerning the generalizability of the findings to other immigrant groups, would be beneficial.

Authors uploaded the revised manuscript.
