1. Round 1

1.1. Reviewer 1

Reviewer:

The abstract should concisely summarize the study's objective, methods, key findings, and conclusions. Currently, it lacks detail on the specific outcomes measured and the significance of the results. Consider adding quantitative data to illustrate the findings more clearly.

Clearly state the research gap this study aims to fill. While the introduction highlights the importance of psychological well-being and rational behavior, it would be beneficial to explicitly mention how this study addresses a specific gap in the existing literature.

Define key terms such as "rational behavior" and "psychological well-being" in the context of this study. Although these terms are discussed, providing operational definitions early in the manuscript would improve clarity.

Authors uploaded the revised manuscript.

1.2. Reviewer 2

Reviewer:

The sampling method described as "convenience sampling" could introduce bias. Consider discussing the potential limitations of this approach and justify why this method was chosen over more rigorous sampling techniques.

The description of the redecision therapy sessions is detailed, but it would be useful to include information on the fidelity of the intervention. How was it ensured that the sessions were delivered consistently across participants?

Provide more detail on the validity and reliability of the Psychological Well-being Questionnaire and the Rational Behavior Questionnaire. Specifically, mention any validation studies conducted in the context of the Iranian population if available.

While ANCOVA is mentioned, the rationale for choosing this statistical method should be elaborated. Explain why ANCOVA was preferred over other potential methods and how it helps in controlling for confounding variables.
